Firewall & Security Guide

In order for IP phones, portals and applications to be able to access the service, some firewalls may need adjusting to allow the traffic through. If the End Customer is running inside to outside rules then ports should be opened to allow the WHC protocols out. There should be no reason for the End Customer to open ports inbound on the firewall.

Please note, whatever device you are using to manage NAT, this should be configured to have a NAT refresh/inactivity timer of not less than 300 seconds

SIP ALG

SIP ALG is the number one issue that will prevent phones registering to the platform and making calls. This is a setting that is quite often turned on automatically on most routers. Please ensure this is turned off on the End Customers router and/or firewalls.
