What is a Virus

Article Number: 82 | Rating: Unrated | Last Updated: Thu, Jul 27, 2017 at 10:04 AM

Computer viruses are small software programs that are designed to spread from one computer to another and to interfere with computer operation.

A virus might corrupt or delete data on your computer, use your e-mail program to spread itself to other computers, or even erase everything on your hard disk. A lot of modern virus software may not damage your machine, but instead use it to distribute spam without your knowledge.

Viruses are most easily spread by attachments in e-mail messages or instant messaging messages. That is why it is essential that you never open e-mail attachments unless you know who it's from and you are expecting it.

 $Viruses\ can\ be\ disguised\ as\ attachments\ of\ funny\ images,\ greeting\ cards,\ or\ audio\ and\ video\ files.$

Viruses also spread through downloads on the Internet. They can be hidden in illicit software or other files or programs you might download.

Ask about our email scanning and spam-checking systems. We can help to filter out viruses and unwanted spam before it arrives.
